A formula from the $\mathrm{EA}_{\mathrm{E}} \mathrm{X}$ Companion, 2nd Edition, p.390:

$$
t\left[u_{1}, \ldots, u_{n}\right]=\sum_{k=1}^{n}\binom{n-1}{k-1}(1-t)^{n-k} t^{k-1} u_{k}
$$

The ISO would prefer that a formula like

$$
\Phi(u)=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{u} e^{-t^{2} / 2} d t
$$

be typeset instead as

$$
\Phi(u)=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{u} \mathrm{e}^{-t^{2} / 2} \mathrm{~d} t
$$

with upright $\pi$, e and d . I dislike the look of $\mathrm{d} t$ when the slope of $t$ is too great.
