

## One-Dimensional Haar Wavelet Transform

### 1 Overview

1.1 **Location** `$(AMDAPPSDKSAMPLESROOT)\samples\opencl\cl\app`

1.2 **How to Run** See the *Getting Started* guide for how to build samples. You first must compile the sample.

Use the command line to change to the directory where the executable is located. The pre-compiled sample executable is at `$(AMDAPPSDKSAMPLESROOT)\samples\opencl\bin\x86\` for 32-bit builds, and `$(AMDAPPSDKSAMPLESROOT)\samples\opencl\bin\x86_64\` for 64-bit builds.

Type the following command(s).

1. `DwtHaar1D`  
Runs with default options; `x = 262144`.
2. `DwtHaar1D -h`  
This prints the help file.

1.3 **Command Line Options** Table 1 lists, and briefly describes, the command line options.

**Table 1 Command Line Options**

Short Form	Long Form	Description
-h	--help	Shows all command options and their respective meaning.
	--device	Devices on which the program is to be run. Acceptable values are <code>cpu</code> or <code>gpu</code> .
-q	--quiet	Quiet mode. Suppresses all text output.
-e	--verify	Verify results against reference implementation.
-t	--timing	Print timing.
	--dump	Dump binary image for all devices.
	--load	Load binary image and execute on device.
	--flags	Specify compiler flags to build kernel.
-p	--platformId	Select platformId to be used (0 to N-1, where N is the number of available platforms).
-d	--deviceId	Select deviceId to be used (0 to N-1, where N is the number of available devices).
-x	--signalLength	Length of the signal.
-i	--iterations	Number of iterations for kernel execution.

## 2 Implementation Details

For a basic one-dimensional Haar Wavelet transform, we make the following assumption: we are given a one-dimensional “image” with a resolution of four pixels, having values

$\{9, 7, 3, 5\}$

We can represent this image in the *Haar basis* by computing a wavelet transform. To do this, we first average the pixels pairwise to get the new, lower-resolution image with pixel values

$\{8, 4\}$

Clearly, some information has been lost in this averaging process. To recover the original four pixel values from the two averaged values, we must store some *detail coefficients*, which capture the missing information. In this example, we choose 1 for the first detail coefficient, since the average we computed is 1 less than 9, and 1 more than 7. This single number lets us recover the first two pixels of our original four-pixel image. Similarly, the second detail coefficient is -1, since  $4 + (-1) = 3$  and  $4 - (-1) = 5$ . Thus, we have decomposed the original image into a lower resolution (two-pixel) version and a pair of detail coefficients. Repeating this process recursively on the averages gives the full decomposition.

Resolution	Averages	Detail Coefficients
4	{9, 7, 3, 5}	
2	{8, 4}	{1, -1}
1	{6}	{2}

Finally, we define the *wavelet transform* (also called the *wavelet decomposition*) of the original four-pixel image to be the single coefficient representing the overall average of the original image, followed by the detail coefficients in order of increasing resolution. Thus, for the one-dimensional Haar basis, the wavelet transform of our original four-pixel image is given by:

$\{6, 2, 1, -1\}$

## 3 Normalized Decomposition Method

See section 2.2 of reference [1] for more details of the normalized decomposition algorithm. The basic steps of this method are:

1. Calculate the levels (resolutions) from the signal length.
2. Calculate the averages and coefficients from the input signal up to nine levels.
3. If levels > 9, calculate the averages and coefficients from the previous averages.
4. Make the decomposed output signal by arranging the overall average of the original signal, followed by the detail coefficients in order of increasing level (resolution).

## 4 Recommended Input Option Settings

For best performance, enter the following in the command line: `-x 8388608 -i 10 -q -t`
