1 Introduction

The code provides an interface to the `\shipout` primitive of \TeX which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.¹

1.1 Overloading the `\shipout` primitive

`\shipout`

With this implementation \TeX ’s `shipout` primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

*This package has version v1.0c dated 2020/09/27, © \LaTeX Project.

¹Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

`\ShipoutBox` This box register is called `\ShipoutBox` (alternatively available via the L3 name `\l_`
`\l_shipout_box` `shipout_box`).

`\l_shipout_box_ht_dim`
`\l_shipout_box_dp_dim`
`\l_shipout_box_wd_dim`
`\l_shipout_box_ht_plus_dp_dim`

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no $\LaTeX 2\epsilon$ names).² These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

²Might need changing, but HO's version as strings is not really helpful I think).

1.2 Provided hooks

`shipout/before`
`shipout/foreground`
`shipout/background`
`shipout/firstpage`
`shipout/lastpage`

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

shipout/before This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`. It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

shipout/background This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of `1pt`. It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

shipout/foreground This hook adds a picture environment into the foreground of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of `1pt`.

Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its (0,0) point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the `.dvi` or `.pdf` output.³

shipout/lastpage The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page — or rather on the page that `LATEX` believes is the last one.

It may not be possible for `LATEX` to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then `LATEX` will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. The other hooks are added inside `hboxes` to the box being shipped out in the following order:

³In `LATEX 2ε` that was already existing, but implemented using a box register with the name `\@begindvibox`.

<code>shipout/firstpage</code>	only on the first page
<code>shipout/background</code>	
<code><boxed content of \ShipoutBox></code>	
<code>shipout/foreground</code>	
<code>shipout/lastpage</code>	only on the last page

If any of the hooks has no code then that particular no box is added at that point.

In a document that doesn't produce pages, e.g., only makes `\typeouts`, none of the hooks are executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

`\AtBeginDvi`
`\AtEndDvi`

`\AtBeginDvi` is the existing L^AT_EX 2_ε interface to fill the `shipout/firstpage` hook. This is not really a good name as it is not just supporting `.dvi` but also `.pdf` output or `.dvi`.

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

Todo: better names? Any suggestions?

1.3 Special commands for use inside the hooks

`\DiscardShipoutBox`
`\shipout_discard_box:`

`\AddToHookNext {shipout/before} {...\DiscardShipoutBox...}`

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard_box:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that L^AT_EX output routine is called in an asynchronous manner!

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it.

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout/background` or `shipout/foreground`.⁴ If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

⁴If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

1.4 Information counters

<code>\ReadOnlyShipoutCounter</code>	<code>\ifnum\ReadOnlyShipoutCounter=...</code>
<code>\g_shipout_readonly_int</code>	<code>\int_use:N \g_shipout_readonly_int % expl3 usage</code>

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)!

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that but if you do, chaos will be the result. To emphasize this fact it is not provided as a \LaTeX counter but as a \TeX counter (i.e., a command), so `\Alph{\ReadOnlyShipoutCounter}` etc, would not work.

<code>totalpages</code>	<code>\arabic{totalpages}</code>
<code>\g_shipout_totalpages_int</code>	<code>\int_use:N \g_shipout_totalpage_int % expl3 usage</code>

In contrast to `\ReadOnlyShipoutCounter`, the `totalpages` counter is a \LaTeX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented).

Furthermore, while it is incremented for each page, its value is never used by \LaTeX . It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by \LaTeX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

<code>\PreviousTotalPages</code>	<code>\thetotalpages/\PreviousTotalPages</code>
----------------------------------	---

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command to a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

1.5 Debugging shipout code

<code>\DebugShipoutsOn</code>	<code>\DebugShipoutsOn</code>
<code>\DebugShipoutsOff</code>	Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.
<code>\shipout_debug_on:</code>	
<code>\shipout_debug_off:</code>	

Todo: This needs some rationalizing and may not stay this way.

2 Emulating commands from other packages

The packages in this section are no longer necessary but as they are used in other packages they are emulated when they are loaded via `\usepackage` or `\RequirePackage`.

2.1 Emulating atbegshi

<code>\AtBeginShipoutUpperLeft</code>	<code>\AddToHook {shipout/before}</code>
<code>\AtBeginShipoutUpperLeftForeground</code>	<code>{... \AtBeginShipoutUpperLeft{<code>}...}</code>

This adds a `picture` environment into the background of the shipout box expecting `<code>` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

```
\AddToHook{shipout/background}{<code>}
```

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `<code>` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

<code>\AtBeginShipoutAddToBox</code>	<code>\AddToHook {shipout/before} {... \AtBeginShipoutAddToBox{<code>}...}</code>
<code>\AtBeginShipoutAddToBoxForeground</code>	

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `<code>` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `<code>` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

<code>\AtBeginShipoutBox</code>	This is the name of the shipout box as <code>atbegshi</code> knows it.
---------------------------------	--

<code>\AtBeginShipoutInit</code>	By default <code>atbegshi</code> delayed its action until <code>\begin{document}</code> . This command was forcing it in an earlier place. With the new concept it does nothing.
----------------------------------	--

<code>\AtBeginShipout</code>	<code>\AtBeginShipout{<code>} ≡ \AddToHook{shipout/before}{<code>}</code>
<code>\AtBeginShipoutNext</code>	<code>\AtBeginShipoutNext{<code>} ≡ \AddToHookNext{shipout/before}{<code>}</code>

This is equivalent to filling the `shipout/before` hook by either using `\AddToHook` or `\AddToHookNext`, respectively.

<code>\AtBeginShipoutFirst</code>	The <code>atbegshi</code> names for <code>\AtBeginDvi</code> and <code>\DiscardShipoutBox</code> .
<code>\AtBeginShipoutDiscard</code>	

2.2 Emulating everyshi

<code>\EveryShipout</code>	<code>\EveryShipout{<code>} ≡ \AddToHook{shipout/before}{<code>}</code>
----------------------------	---

<code>\AtNextShipout</code>	<code>\AtNextShipout{<code>} ≡ \AddToHookNext{shipout/before}{<code>}</code>
-----------------------------	--

2.3 Emulating atenddvi

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box.

2.4 Emulating everypage

This page takes over the original `\@begindvi` hook and replaces it. It should be all covered by the hooks offered here (details need checking) and thus could simply use the provided hooks rather than defining its own.

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.

A		int commands:	
<code>\AddToHook</code>	<i>5, 5, 5, 5</i>	<code>\int_use:N</code>	<i>4, 4</i>
<code>\AddToHookNext</code>	<i>3, 5, 5</i>	P	
<code>\Alph</code>	<i>4</i>	<code>\PreviousTotalPages</code>	<i>4</i>
<code>\arabic</code>	<i>4</i>	<code>\put</code>	<i>2, 5</i>
<code>\AtBeginDvi</code>	<i>3, 5</i>	R	
<code>\AtBeginShipout</code>	<i>5</i>	<code>\ReadOnlyShipoutCounter</code>	<i>4</i>
<code>\AtBeginShipoutAddToBox</code>	<i>5</i>	<code>\ReadonlyShipoutCounter</code>	<i>4, 4</i>
<code>\AtBeginShipoutAddToBoxForeground</code>	<i>5</i>	<code>\RequirePackage</code>	<i>4</i>
<code>\AtBeginShipoutBox</code>	<i>5</i>	<code>\Roman</code>	<i>4</i>
<code>\AtBeginShipoutDiscard</code>	<i>5</i>	S	
<code>\AtBeginShipoutFirst</code>	<i>5</i>	<code>\shipout</code>	<i>1, 1, 3</i>
<code>\AtBeginShipoutInit</code>	<i>5</i>	shipout commands:	
<code>\AtBeginShipoutNext</code>	<i>5</i>	<code>\l_shipout_box_dp_dim</code>	<i>1</i>
<code>\AtBeginShipoutUpperLeft</code>	<i>5, 5</i>	<code>\l_shipout_box_ht_dim</code>	<i>1</i>
<code>\AtBeginShipoutUpperLeftForeground</code>	<i>5, 5</i>	<code>\l_shipout_box_ht_plus_dp_dim</code>	<i>1</i>
